

The least expensive backup detection system available

Instead of backing blindly into an area, why not let a microwave sensor tell you how far you are away from a wall, deck or dangerous situation? We feature ROSS (Rear Obstacle Sensing Systems) products. The Rostra ROSS system consists of a visual display strip, two bumper-mounted sensors, a wire harness, and an audio controller. The visual display strip consists of three LED indicators that attach to the windshield. This display strip will change in color sequence as an obstacle nears, giving you time to prevent a collision.

1. Solid green (indicates the area is clear)
2. Flashing green
3. Yellow flash while green remains constant
4. Flashing red while green and yellow remain constant
5. Green, yellow and red constant (indicates immediate danger)

When you are in reverse, the system will detect an obstacle up to 12' away. For added protection, an audio alarm will increase in frequency as the LED strip changes colors. Because the sensor is microwave-based, it will not be blocked by snow or ice. Call for pricing!

#R-4500-224P Rooftop Condensator.

#R-9757-0 Rooftop A/C-Heater. Off Road.

Also useful for making cup holders, seat belts and even wedding rings in a pinch!

1942 also ushered in a new era in automotive mechanics with the advent of duct tape. Although its talents were first wasted on sealing ammunition boxes and then heating ducts, it is now recognized the world over as the ultimate car repair tool. To quote Lenny Minkle of Boring, Oregon, "I keep duct tape and a screw driver in every glove box. That way if the tape don't fix it, I kin always unscrew the license plate and walk away."
